What is Fotona 4D™?

Fotona 4D is a series of synergistic, non-invasive laser treatments of both the exterior face and interior oral cavity, enabling full-thickness contraction of collagen for persistent tightening and volumization (wrinkle reduction) without injectables.

The four “dimensions” of Fotona4D

1- SmoothLiftin™

The first step involves a pain free treatment which targets volume through a process called collagen induction. The effects are an overall improvement of tightness and elasticity of the skin along with a plumping effect, much like a filler.

2- FRAC3®

The second step involves the targeted treatment of specific, deeper imperfections in the skin like spots and vascular components using a fractional laser. This is fast, effective and will help restore youthful texture.

3- PIANO®

The third stage of Fotona 4D involves heating the skin safely and rapidly from the outside in by concentrating energy delivery subcutaneously. This is done using a brushing technique and provides an outstanding tightening effect for areas experiencing skin laxity

4- SupErECIAL™

The final stage is like a polishing effect for your skin. The treatment removes dead skin cells to reveal the brighter, healthier tissue below and provides that noticeable “glow” to your skin.

What can I expect from the treatments?

Each person is different but you can expect minimal to no discomfort during the treatment. Immediately following treatment, you may experience some redness or swelling that will diminish after a few hours. Most patients can resume their daily activities immediately following the treatment.
